

① Assertion: When radius of a current carrying loop is doubled, its magnetic moment becomes four times

Reason: The magnetic moment of a current carrying loop is directly proportional to the area of the loop.

② Equipotentials at a large distance from a collection of charges whose total sum is not zero is:- a) spheres b) planes c) ellipsoids d) paraboloids.

③ Four charges $-q, -q, +q, +q$ are placed at the corners of a square of side $2L$ as shown in figure. The electric potential at point A midway between the two charges $+q$ and $+q$ is:-

④ A charge particle after being accelerated through a potential difference ' V ' enters in a uniform magnetic field and moves in a circle of radius r . If V is doubled, the radius of the circle will become

- a) $2r$ b) $\sqrt{2}r$
c) $4r$ d) $r/\sqrt{2}$
